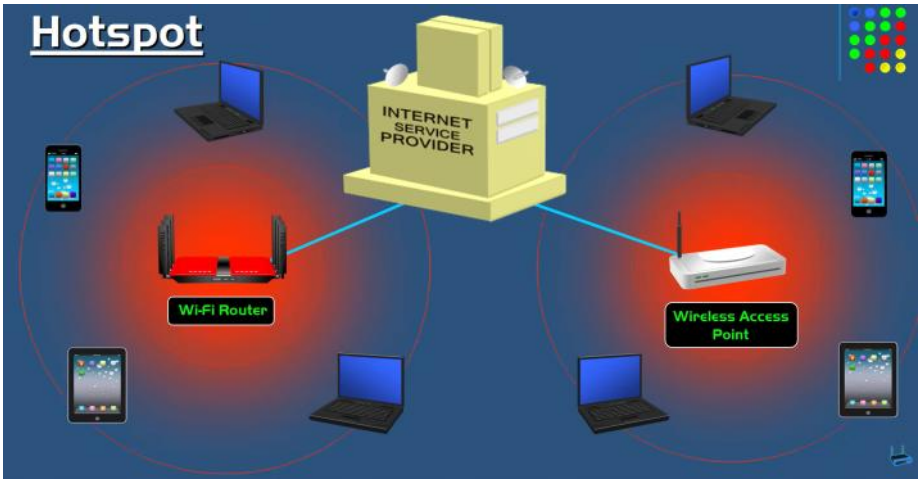
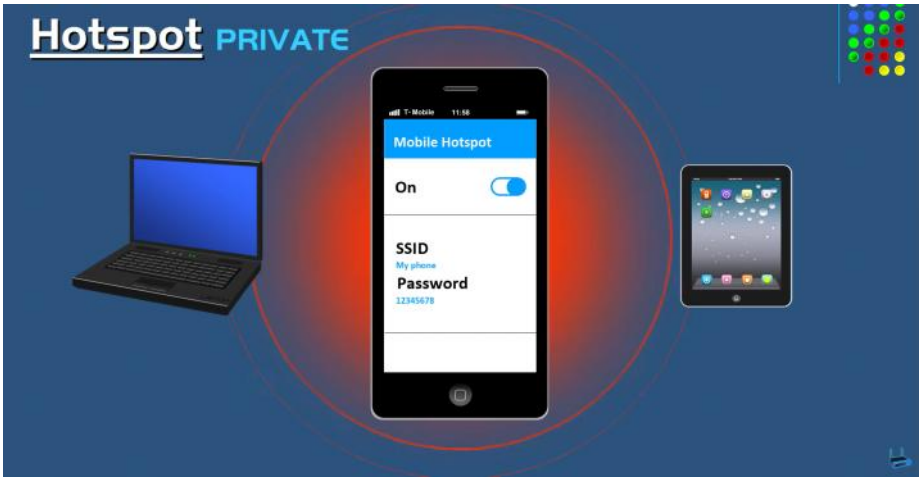
Hotspot

Saturday, March 21, 2026 4:25 PM

A hotspot is a specific physical location where users can access the internet wirelessly using mobile devices like laptops, tablets, or smartphones. Hotspots can be public (found in coffee shops, hotels, or airports) or private (such as a home Wi-Fi network or a smartphone's tethering feature).





These locations are created by Wi-Fi routers or wireless access points connected to an internet service provider. While some hotspots are free, others require a password or payment to connect. When using public hotspots, it is recommended to take security precautions like using a VPN (Virtual Private Network) to encrypt data and protect against hackers.
