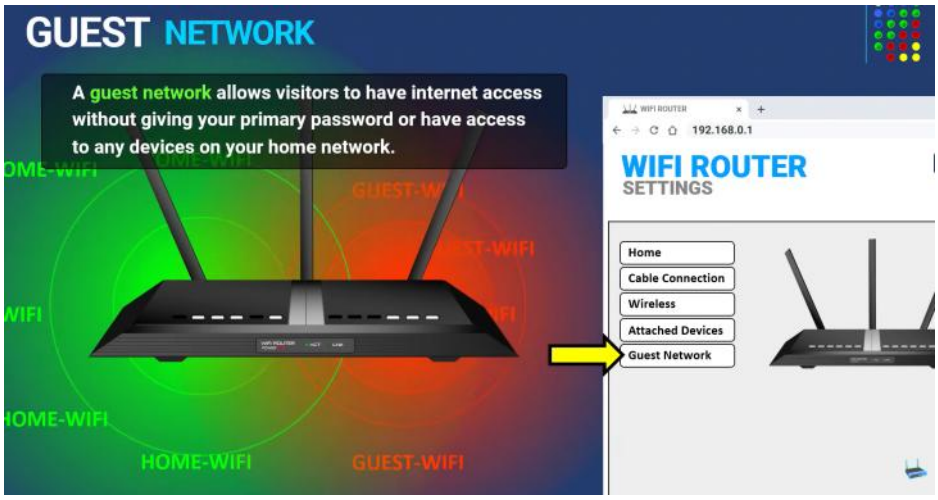
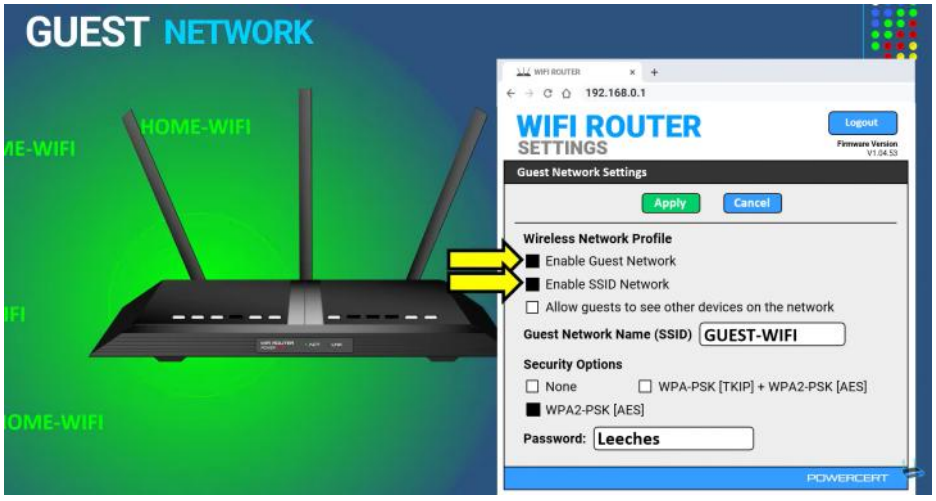
Guest Wi-Fi

Sunday, March 29, 2026 8:26 AM

A guest network is a feature on modern Wi-Fi routers that creates a separate, isolated network for visitors. This allows guests to access the internet without needing the primary Wi-Fi password or gaining access to other devices on the home network.





Setting up a guest network enhances security by preventing the spread of viruses from guest devices to personal ones. It is highly recommended to password-protect this network to prevent unauthorized users from stealing bandwidth or engaging in malicious activity. The guest network operates on the same frequency band as the main network but uses firewall-like rules to keep traffic separated.

It will create 2 SSIDs now Home Wi-Fi and Guest Wi-Fi. It is creating from same radio frequency band separated by firewall rules.
