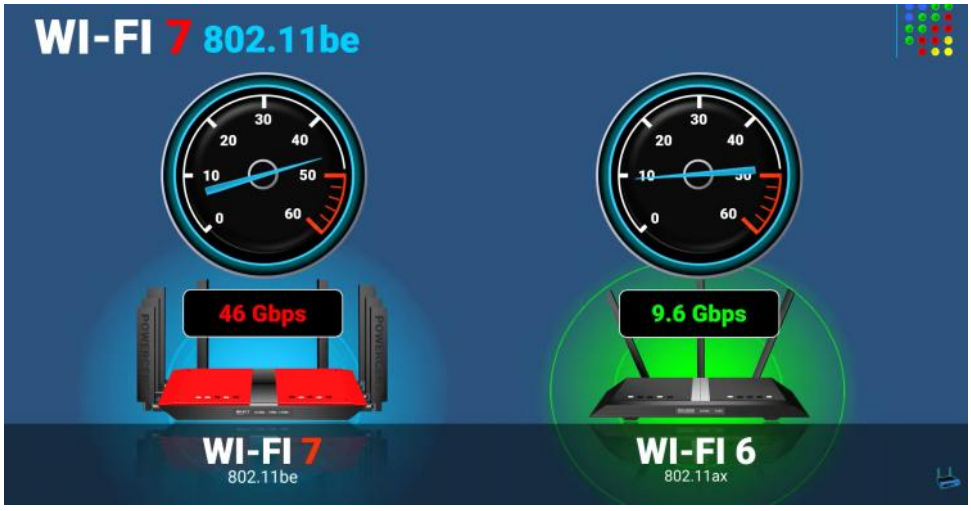
Wi-Fi 7

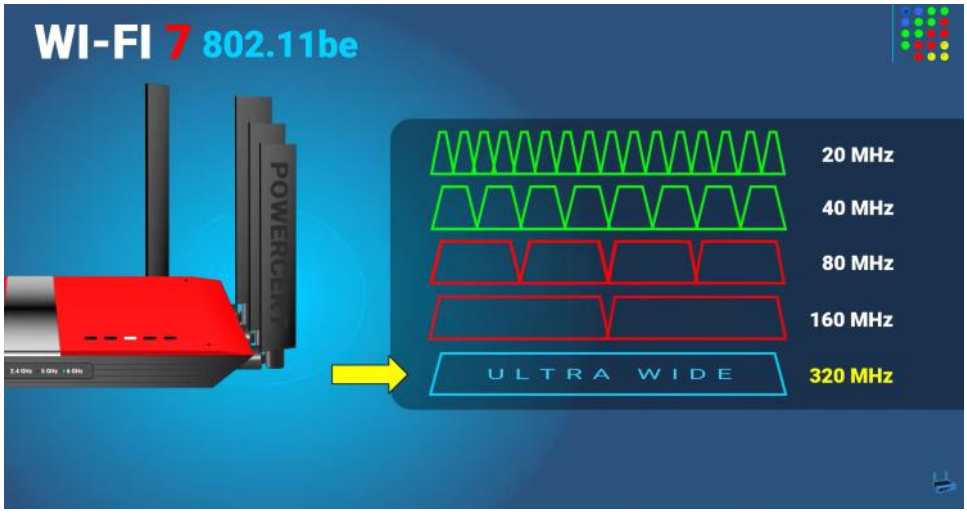
Saturday, March 28, 2026 11:34 PM

Wi-Fi 7 (802.11be) is the newest wireless standard released in 2024, designed for extremely high throughput (speed) rather than just connecting more devices. It achieves speeds up to 46 Gb per second.

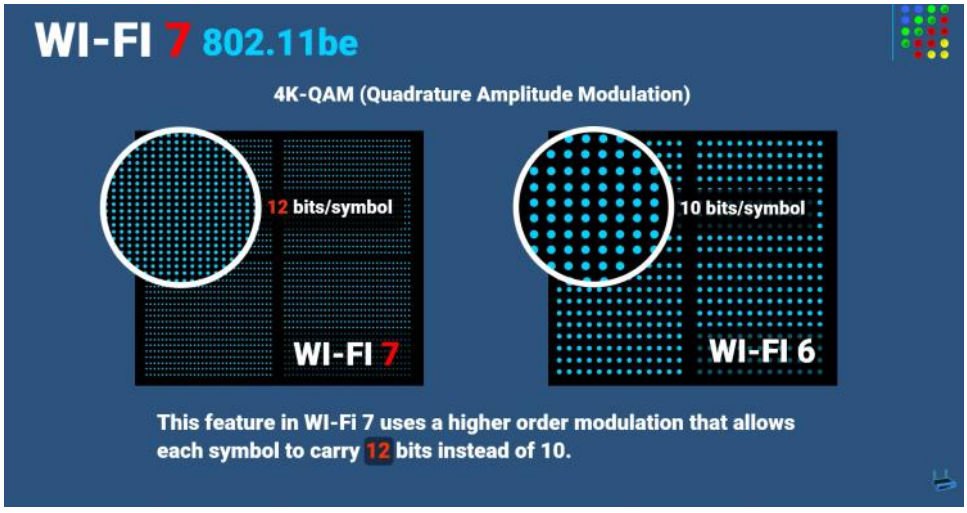


Key Features:

6 GHz Band: Provides more channels with significantly less interference but has a shorter range

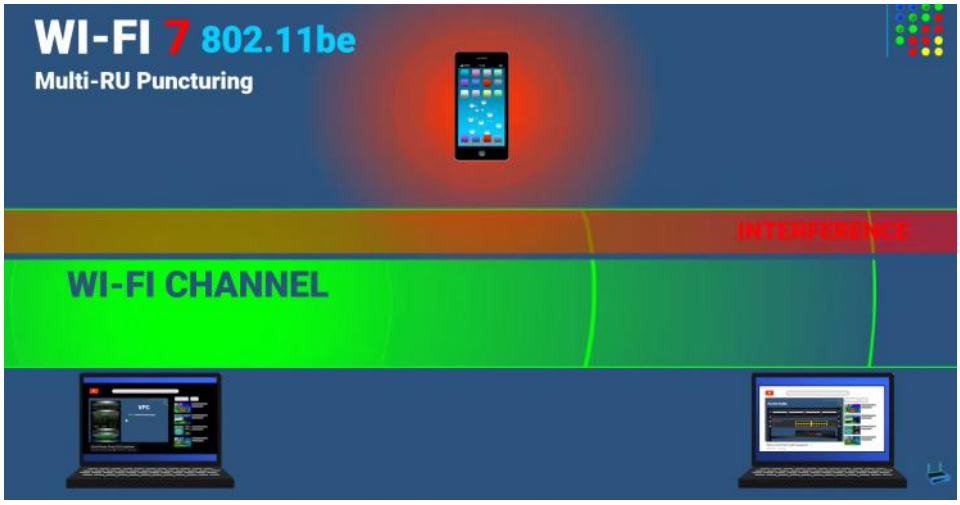


320 MHz Channel: Doubles the bandwidth of Wi-Fi 6, allowing much faster data transfer but it has sure have shorter range (6GHz)



4K-QAM: Packs 20% more data into each signal for higher speeds

MLO (Multi-Link Operation): Connects devices to multiple bands simultaneously for faster speeds and reliability



Multi-RU Puncturing: Slices out interfered portions of a channel so the rest of the channel can still be used

16x16 MU-MIMO: Supports 16 simultaneous streams for better performance in crowded areas
