MX RECORD

The MX record, or mail exchanger record, is used for email and points to the server where emails for a specific domain name should be delivered. When an email is sent to an address like Tom@example.com, the mail transfer agent queries the MX records for example.com to find the correct email server. MX records typically include both a primary and a secondary email server, along with priority numbers. A lower priority number indicates the primary server, but if the primary server is unavailable, the secondary server is used.

	TYPE	PRIORITY	NAME	HOST	TTL
Primary	MX	10	example.com	mail1.example.com	7200
Secondary	MX	20	example.com	mail2.example.com	7200

mail1.example.com

mail2.example.com
