

USB Ports

Monday, May 4, 2026 8:23 PM

USB (Universal Serial Bus) is a standard used to connect devices like keyboards, mice, printers, cameras, and external drives to a computer. It is widely used because it is universal, easy to use, supports fast data transfer, allows hot swapping (plug and play), and can also supply power to devices.

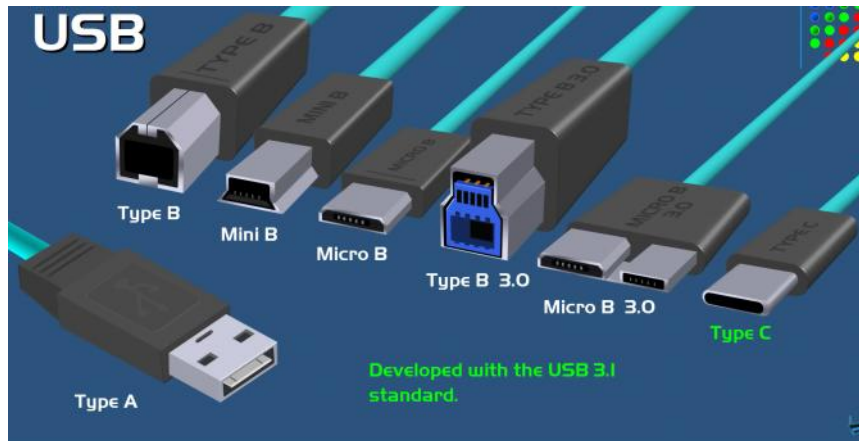

USB evolved over time with increasing speeds:

USB 1.0 and 1.1 were very slow, USB 2.0 improved speed significantly, USB 3.0 and later versions (3.1, 3.2, USB4) offer very high data transfer rates up to 40 Gbps.

There are different types of USB connectors:

Type A is the standard rectangular port on computers, Type B is mostly used for printers, Mini and Micro USB are smaller versions for older devices, and USB Type C is the modern standard which is reversible, faster, and can charge even laptops.

USB cables usually have different connectors on each end, but USB C cables can have the same connector on both ends.

USB ports are color coded to indicate versions:

White for old versions, black for USB 2.0, blue for USB 3.0, teal for USB 3.1, and red for USB 3.2. Some ports also support charging even when the computer is in sleep mode.
