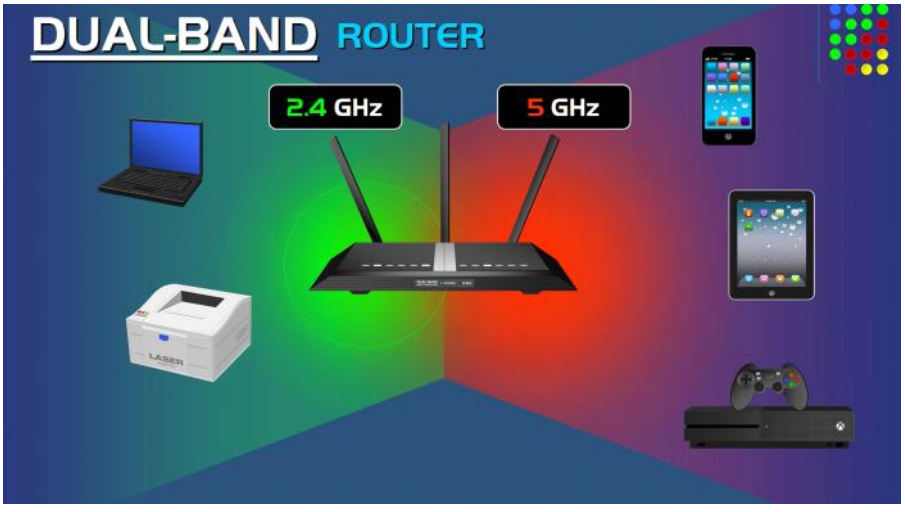
Tri-Band Wi-Fi Router

Sunday, March 22, 2026 7:38 PM

A tri band router is a Wi-Fi router that broadcasts three frequency bands one 2.4 GHz and two 5 GHz bands.

Single band routers use only 2.4 GHz which can become slow due to many devices and interference.



Dual band routers add a 5 GHz band to reduce congestion by splitting devices.

Tri band routers go further by adding an extra 5 GHz band creating three separate networks. This reduces crowding and improve s speed and stability especially when many devices are connected.

They also use smart connect which automatically assigns devices to the best band slower devices go to 2.4 GHz and faster devi ces use 5 GHz bands.
Best for homes with many devices usually more than 10 to 15 where better performance and smoother internet is needed.
