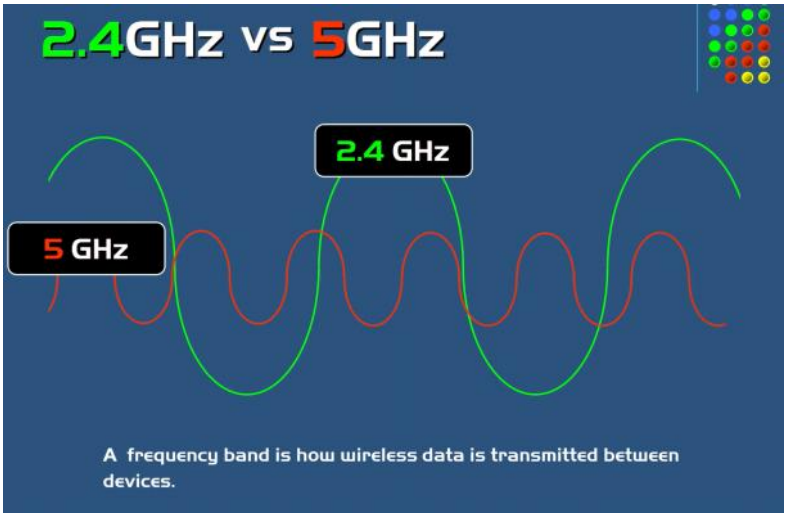
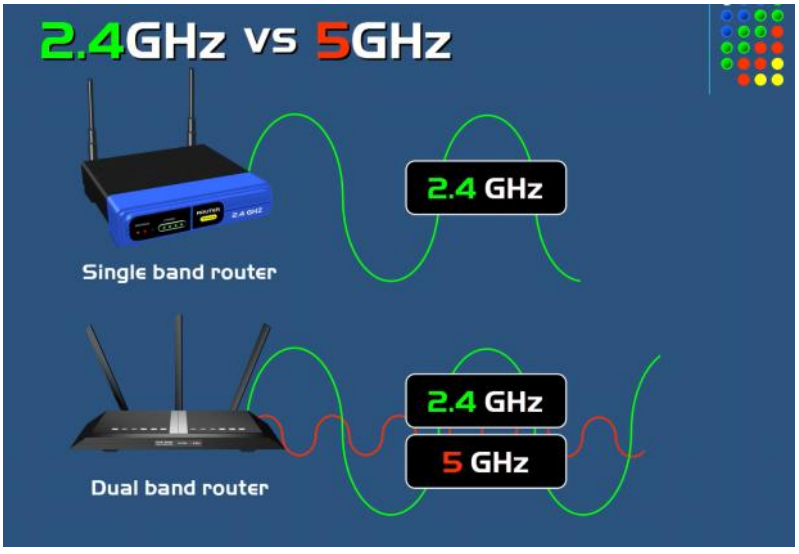
2.4 GHz vs 5 GHz Wi-Fi

Friday, March 20, 2026 5:47 PM

Wi Fi 2.4 GHz vs 5 GHz

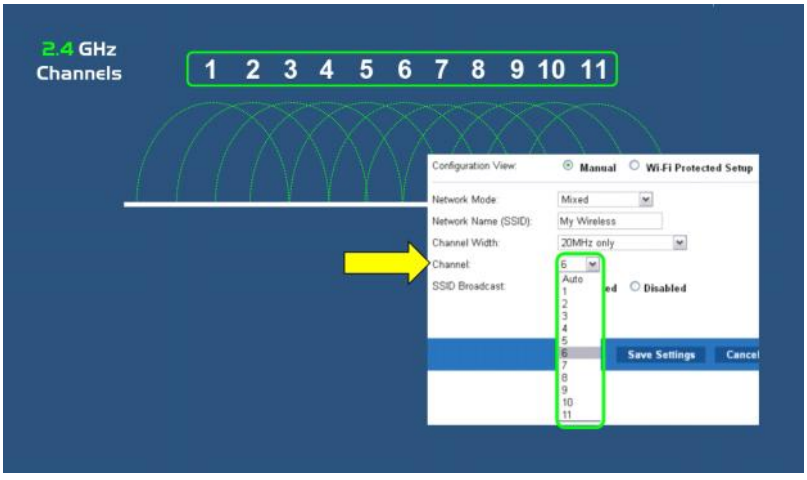


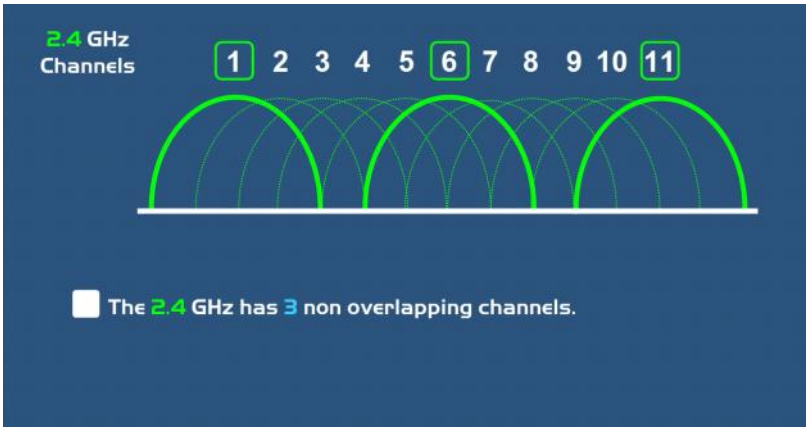
Wi Fi uses frequency bands to send data between devices mainly 2.4 GHz and 5 GHz



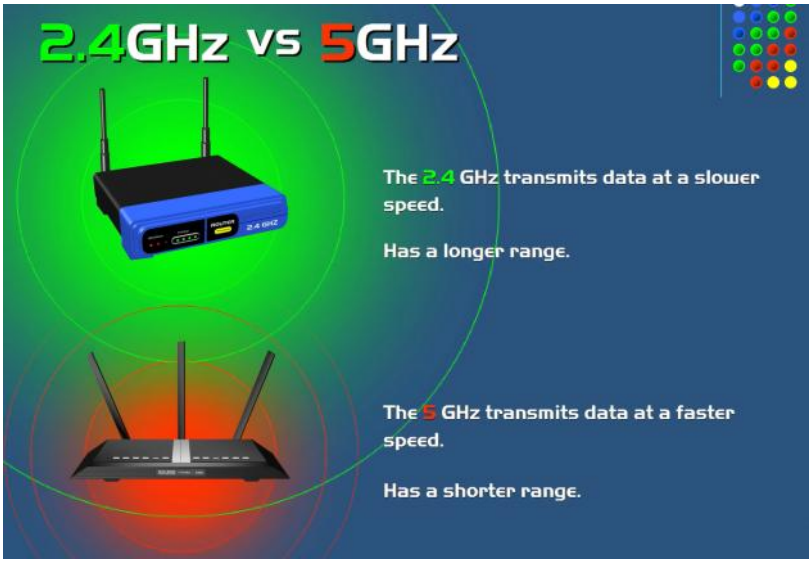
2.4 GHz is widely used so it faces more interference from devices like Bluetooth and microwaves It has slower speed but longer range and better wall penetration

5 GHz is less crowded so it has less interference and faster speed but shorter range and weaker signal through walls

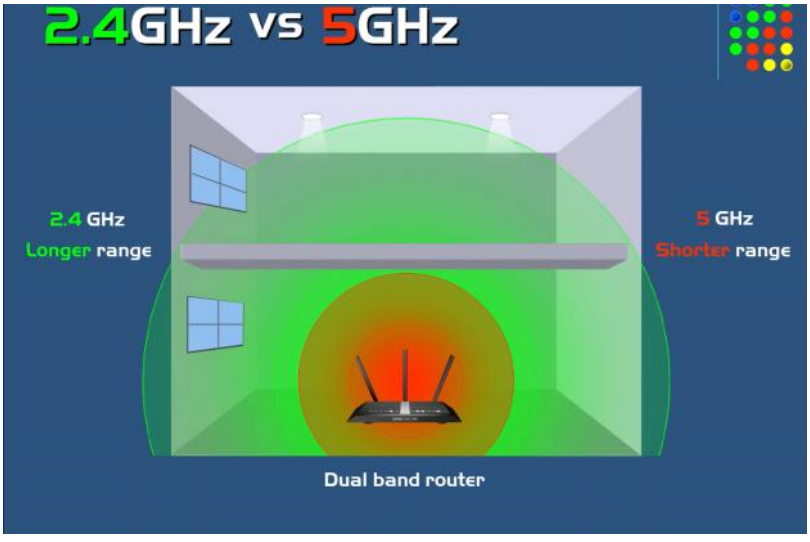


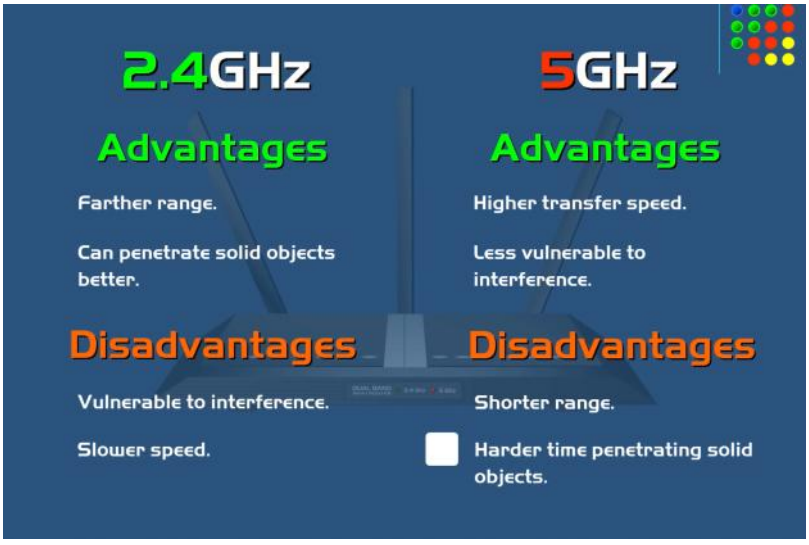


2.4 GHz has only 3 non-overlapping channels while 5 GHz has many more which improves performance. It have over 25 non-overlapping channels



Use 2.4 GHz for longer distance and walls
Use 5 GHz for high speed when you are close to the router





Dual band routers provide both options so you can choose based on your need
